

**IN THE SPECIFICATION:**

Please amend originally filed paragraph [0063] on page 16 as follows:

[0063]

(1) The explosive used in the first explosive layer is not limited to the granular explosive ANFO. An emulsified (fluidal) explosive ~~such as PETN-based explosive~~ may be used in the first explosive layer. In such a case, it is possible to form a first explosive layer surrounding bomb to be processed in a simple operation, by filling the emulsified explosive inside the cylinder 22 and then immersing the bomb to be processed in the infused emulsified explosive.
